American Astronomical Society Assumes Leadership of WorldWide Telescope

by Staff Writers

Los Angeles CA (SPX) Jan 20, 2016

Microsoft's WorldWide Telescope (WWT) astronomy software has a new institutional home: the American Astronomical Society (AAS). This follows a vote by the Society's governing board at the 227th AAS meeting in Kissimmee, Florida, earlier this month.

WWT is a scriptable and interactive "universe information system" for exploring the multiwavelength sky. It allows users to retrieve and share data using an interface that resembles either the sky as seen from Earth or a 3D view of the universe.

WWT can be run in a browser on any computer or mobile device or in Windows as a desktop application. With its powerful capabilities to visualize and contextualize

Virtually anyone can use WWT to simply browse the universe, exploring everything from planets to nebulas, from supernovas to galaxy clusters, and from constellations to the cosmic microwave background radiation.

PINEDA ET AL.

2015: FILAMENT FRAGMENTATION → STAR FORMATION?

WE NOW ALSO KNOW THAT B5 IS FORMING A BOUND CLUSTER

*“filament fragmentation
on scales of $\sim 5,000$ AU
offers a viable pathway to the
formation of multiple systems”*

The background of the slide is a deep red, textured astronomical image, possibly showing a star's surface or a nebula. In the center, there is a bright, irregularly shaped region with a yellow and green core, surrounded by a darker, reddish-brown filamentary structure. The overall appearance is that of a complex, multi-layered celestial object.

2016'S *Twisted* TALE
WHAT IF FILAMENTS CROSS CORE
BOUNDARIES?

Jaime Pineda, ETH Zurich & MPE
Stella Offner, UMASS

WHAT IF FILAMENTS CONTINUE ACROSS "CORE" BOUNDARIES?!

blue =VLA ammonia (high-density gas); green=GBT ammonia (lower-res high-density gas); red=Herschel 250 micron continuum (dust)

Hmmm...

Filaments offer pre-existing density enhancement.

Collapse is rapid enough that aboriginal filament is not erased, even within a "coherent core."

In B5, small bound cluster will form c. 40K years from now.

Now, we are trying *FIVE*, from Hacar et al. 2013, and other clustering algorithms, to study “coherent” core-filament relation.

Filaments offer pre-existing density enhancement.

Collapse is rapid enough that aboriginal filament is not erased, even within a “coherent core.”

In B5, small bound cluster will form c. 40K years from now.

HOT OFF THE PRESS: "FIBERS" WITHIN B5

There are at least three different components in the position-position-velocity space.

And potentially, many more...

Yes but why not at Zero of Latitude ($b=0$)?

Where are we, really?

“IAU Milky Way”, est. 1959

True Milky Way, modern

The equatorial plane of the new co-ordinate system must of necessity pass through the sun. It is a fortunate circumstance that, within the observational uncertainty, both the sun and Sagittarius A lie in the mean plane of the Galaxy as determined from the hydrogen observations. If the sun had not been so placed, points in the mean plane would not lie on the galactic equator. *[Blaauw et al. 1959]*

ABSTRACT

“We present the first evidence of additional bones in the Milky Way Galaxy, arguing that Nessie is not a curiosity but one of several filaments that could potentially trace Galactic structure.”

Key words: Galaxy: kinematics and dynamics – Galaxy: structure – ISM: clouds

Figure 1. Results of performing a slice extraction along the filamentary extinction feature of our strongest bone candidate, filament 5. The top panel shows a *Spitzer*-GLIMPSE $8\ \mu\text{m}$ image of filament 5, and the red trace indicates the curve (coincident with the extinction feature) along which a p - v slice was extracted. The bottom panel shows the p - v slice, with the red boxed region indicating the emission corresponding to filament 5.

Figure 2. Position-velocity summary of bone candidates and spiral arm models. Blue background shows ^{12}CO emission from Dame et al. (2001), integrated between $-1^\circ < b < 1^\circ$. Black dots show measurements of BGPS-, HOPS-, MALT90-, and GRS-determined velocities, with particular candidate filaments identified by number (see Table 1 for further identification), or, in the case of Nessie, by name. Lines of varying color show predicted p - v spiral arm traces from the literature (see text for references).

Constant CO Abundance	No	$1.75 \text{ e-}4$
$^{12}\text{CO}/^{13}\text{CO}$ abundance	70	70
Radiative Transfer Code	RADMC 3D	RADMC 3D
Microturbulence	0.2 km s^{-1}	0.2 km s^{-1}
Metallicity	Solar	N/A
Mean number density (nH)	100 cm^{-3}	58 cm^{-3}
Mach Number	~ 6	22
Isothermal?	No	Yes
Output time(s)	5.7 Myr	2.5 Myr
Mass in stars	N/A	722 M_{sun} (2.4%)

Fig 6

FUNDAMENTAL?

A&A 578, A29 (2015)

Fig 8

Fig. 9. Main beam brightness temperature spectra of $^{12}\text{CO } 3 \rightarrow 2$ (black) and $^{13}\text{CO } 1 \rightarrow 0$ (red) emission in the velocity range 55 to 95 km s $^{-1}$ and temperature range -0.2 to 12 K. The area corresponds to the centre region of the IRDC G28.37+0.07, outlined in Fig. 8. The dust column density from *Herschel* is overlaid as blue contours (levels 4, 5, 7, 10, 16 $\times 10^{22}$ cm $^{-2}$), and the numbering from 1 to 6 indicates the position of submm-continuum sources labelled using ATLASGAL and subsequently observed in N_2H^+ (Tackenberg et al. 2014).

Figure 8. Enclosed mass profiles for characteristic filaments of star-forming regions NGC 3603, Auriga, and G216-2.5, whose *N*-pdfs are based on *Herschel* observations (Schneider et al. 2014b). Each colored curve is based on the LNPL fit by Schneider et al. (2014b) to the observed *N*-pdf. The red part of each mass profile arises from the PL component of the *N*-pdf and the blue part arises from the LN component. The black line shows the enclosed mass profile of a filament having uniform column density. The degree of central concentration of each profile increases with the star formation activity of each region.

Fig. 6. Top: H_2 column density from dust continuum with the white contour, roughly outlining the GMC in which G28.37+0.07 is embedded. Bottom: PDFs of the GMC, derived from the dust column density map from the left above different A_v -thresholds (indicated with different colours and given in the panel).
